

AutoLister Dealer Onboarding Packet

Inventory connection, installation, validation, and operating guide

This packet explains what your dealership needs to provide and what TeeJay's Tech Tools will configure after your AutoLister subscription begins. The goal is a controlled inventory workflow that loads current vehicles, identifies price changes, and identifies sold units for an authorized user to review and process from dashboard buttons.

Your service	Working subscription	Operating model
AutoLister Inventory Sync	\$499 per month	Script based and review first

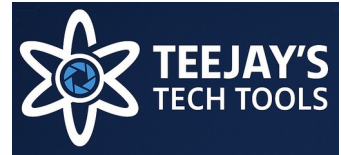

What you will complete

- ☐ Submit the non-secret dealership and inventory-source details listed in this packet.
- ☐ Choose a dealer-provided feed when available, with the public dealership website as a fallback.
- ☐ Install the AutoLister Chrome package on each approved workstation included in your order.
- ☐ Validate one new listing, one price change, and one sold-unit removal before broader use.

Do not email passwords, API keys, SFTP private keys, customer records, or payment-card information.

The onboarding email will provide a secure setup link for any protected details that are actually required.

Prepared for dealership owners, managers, inventory staff, and approved AutoLister operators.

Start here

After Square confirms the first subscription payment, TeeJay's Tech Tools creates a dealer workspace and sends the purchaser an onboarding email. That email contains this packet and a secure setup link. Payment confirmation alone does not mean the feed is connected or the dealership is live.

Stage	Dealer action	TeeJay's Tech Tools action	Completion proof
1 Intake	Submit dealership and inventory-source details.	Create an isolated dealer workspace and access token.	Workspace ID and intake status are recorded.
2 Connect	Authorize the feed or approve the public website source.	Map source fields and run the first complete import.	VIN, stock, price, status, and vehicle totals are checked.
3 Install	Install Chrome package on approved workstations.	Connect the dashboard to the dealer workspace.	Dashboard loads the correct dealership inventory.
4 Validate	Review controlled test actions.	Verify create, price-update, and sold-removal behavior.	Each action has a source record and a verified result.

Dealer information to prepare

- ☐ Legal business name, public dealership name, rooftop name, and primary website.
- ☐ Primary onboarding contact, inventory contact, and the staff members who will operate AutoLister.
- ☐ Current inventory provider or DMS feed contact, if a feed is available.
- ☐ Public new and used inventory search URLs for website fallback.
- ☐ The exact source price field the dealership wants shown on Marketplace.
- ☐ How the source represents sold, inactive, wholesale, pending, and unavailable vehicles.
- ☐ The Facebook accounts and Marketplace access the dealership is authorized to use. Do not send passwords.

Dealer intake worksheet

Use this worksheet to prepare the non-secret information for the secure online onboarding form.

Item	Dealer response
Dealership and rooftop	
Primary contact and email	
Inventory or feed contact	
Website and inventory search URL	
Preferred source HTTPS feed, SFTP batch, or website	
Price field and sold status field	
Approved AutoLister operators	

Inventory connection

A dealer-provided feed is the preferred source because it is explicit, stable, and easier to reconcile. AutoLister can accept an authorized HTTPS JSON, CSV, or XML feed or a push from an existing SFTP or batch process. If a feed is not available, AutoLister can use the public dealership website as a fallback when the inventory data is accessible in server-rendered vehicle markup.

Source option	Best use	Dealer provides	Important limitation
Authorized feed	Primary production source	Feed URL or batch-provider coordination, format, and field definitions	Feed access must remain authorized and available.
Existing SFTP or batch export	Dealers already sending nightly inventory files	Provider contact, delivery schedule, and approved file mapping	A secure adapter is configured outside the Chrome extension.
Public dealership website	Fallback or pilot	Inventory search URL and permission to use the public data	JavaScript-only websites may require a deterministic vendor adapter.

Required vehicle fields

Field	Why it matters	Rule
VIN	Primary vehicle identity	Used first when a valid VIN is available.
Stock number	Dealer reference and fallback identity	Used as identity only when no usable VIN exists.
Year, make, model, trim	Marketplace vehicle details	Imported from the authorized source.
Price	Listing and price-change comparison	The selected source price is imported exactly; AutoLister does not invent rebates or fees.

Required vehicle fields continued

Field	Why it matters	Rule
Mileage	Vehicle disclosure	Must come from the selected source when required.
Status	Active versus sold or unavailable	Explicit sold or unavailable status can create a removal action immediately.
Photos	Marketplace gallery preparation	Only dealer-authorized source images are used.
Vehicle URL	Source proof and operator review	Links the operator back to the dealership record.

Sold-unit protection

An explicit sold or unavailable record can create a removal action immediately. If a vehicle merely disappears from a source, AutoLister waits for two consecutive complete scans before creating the sold-removal action. An incomplete or capped website scan cannot advance that missing counter.

Installation and connection

AutoLister is a Chrome extension connected to a TeeJay's Tech Tools dealer workspace. The installation does not require an AI account or AI API key. The dealer access token is unique to the dealership and should be stored only in the approved browser profile.

Before installation

- ☐ A current Google Chrome installation on each approved Windows or macOS workstation.
- ☐ An authorized Chrome profile controlled by the dealership or approved operator.
- ☐ Authorized Facebook access and Marketplace eligibility for the operator.
- ☐ The AutoLister installation package and secure dealer connection details from TeeJay's Tech Tools.

Install the Chrome package

1. Download the AutoLister package from the time-limited setup link.
2. Extract the package to a permanent dealership-controlled folder.
3. Open `chrome://extensions` and enable Developer mode for the approved installation.
4. Choose Load unpacked and select the folder containing `manifest.json`.
5. Open TeeJay's AutoLister and choose Open Inventory Dashboard.
6. In Settings, enter the service URL, dealer ID, and dealer access token from the secure setup page.
7. Save the connection and confirm that the correct dealership name appears before importing or changing anything.

Connection check

- ☐ The correct dealership name and dealer ID appear.
- ☐ The primary feed or website source appears under Sources.
- ☐ A manual scan completes and reports a plausible vehicle count.
- ☐ The vehicle table shows VIN, stock, price, and source status without demo records.
- ☐ No Marketplace action has been run before the controlled validation step.

Operating AutoLister

AutoLister runs from dashboard buttons. It does not need AI and it is not configured to make daily price or sold-unit changes automatically. An operator chooses when to scan and chooses each Marketplace action after reviewing the source record.

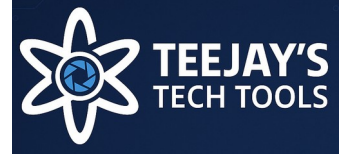

Dashboard action	What the script does	Operator proof before completion
Scan inventory	Pulls the configured source and compares it with the dealer ledger.	Source status is complete and the observed vehicle count is plausible.
Prepare listing	Opens the supported Facebook vehicle workflow and prepares source-backed fields.	The operator checks price, mileage, equipment, disclosures, photos, and description before publishing.
Update price	Changes the connected Marketplace listing to the selected source price.	Old and new prices are shown; AutoLister verifies the resulting listing price.
Delete listing	Removes the connected Marketplace listing for a confirmed sold unit.	The operator confirms the VIN or stock and AutoLister verifies the removal result.

Recommended operating routine

- ☐ Open the dashboard and confirm the dealership and source status.
- ☐ Click Scan inventory when you want a fresh comparison.
- ☐ Review New, Price changes, and Sold queues before running any script.
- ☐ Process one action at a time and confirm that the VIN, stock number, and public listing belong together.
- ☐ Treat an action as complete only after AutoLister reports a verified result.
- ☐ Stop and contact support if the source count changes unexpectedly, a price field is blank, or Facebook changes its form behavior.

What AutoLister does not do

- It does not scrape CarGurus as the dealer inventory authority.
- It does not invent prices, rebates, fees, mileage, equipment, or vehicle status.
- It does not bypass Facebook login, access controls, Marketplace eligibility, or the operator's final publish decision.
- It does not call an AI model or require an AI subscription.
- It does not automatically change every price or delete every sold unit on a daily schedule unless a separate, approved automation is added later.

Validation and go live

A dealer is not considered live when the subscription is paid or the extension is merely installed. Go live occurs only after the source is connected, the correct rooftop is proven, and controlled listing actions are verified in the dealership's authorized Marketplace account.

Launch checklist

- ☐ Square subscription is active and matched to the dealer workspace.
- ☐ Dealership name, rooftop, website, contacts, and approved operators are recorded.
- ☐ Primary inventory source is authorized and field mapping is documented.
- ☐ Website fallback is configured only if approved and technically supported.
- ☐ First complete scan total is reconciled to the dealer's source total.
- ☐ A representative VIN has correct stock, price, mileage, status, photos, and source URL.
- ☐ One new-listing workflow is reviewed and verified.
- ☐ One price-change workflow is reviewed and verified, when a safe test record is available.
- ☐ One sold-removal workflow is reviewed and verified, when a safe test record is available.
- ☐ Dealer operator knows how to stop, review, and contact support.

Support information to include with a request

- Dealership name and rooftop.
- VIN and stock number for the affected unit.
- Which button was used and the exact message shown.
- Whether the source feed or website showed the expected vehicle and price.
- A screenshot that does not expose passwords, access tokens, customer records, or private messages.

Subscription and support

The working offer for AutoLister Inventory Sync is \$499 per month, billed through Square. The live Square checkout will show the final recurring price, cadence, included scope, cancellation terms, and any applicable taxes before the buyer confirms payment. No setup fee is included in this draft offer.

Included in the working offer	Handled separately when needed
Dealer workspace and inventory ledger	Custom DMS or vendor integrations beyond supported feed formats
One authorized feed or supported website fallback	Major vendor-specific website adapter development
Chrome package and onboarding guidance	Additional custom workflow, policy, or reporting work
Manual scan, create, price-change, and sold-removal workflow	Unattended scheduling or direct Facebook partner API work
Initial controlled validation and reasonable setup support	Work caused by unsupported third-party platform changes outside the agreed support scope

Dealer acknowledgement

The dealership remains responsible for the accuracy and legality of its listings, the accounts it authorizes, required disclosures, and each final publish or deletion decision. AutoLister is an operations tool and does not guarantee Marketplace access, listing reach, leads, or vehicle sales.

This onboarding packet is an operating guide. The subscription checkout and AutoLister service terms control the commercial agreement.
